1 The scoreboard

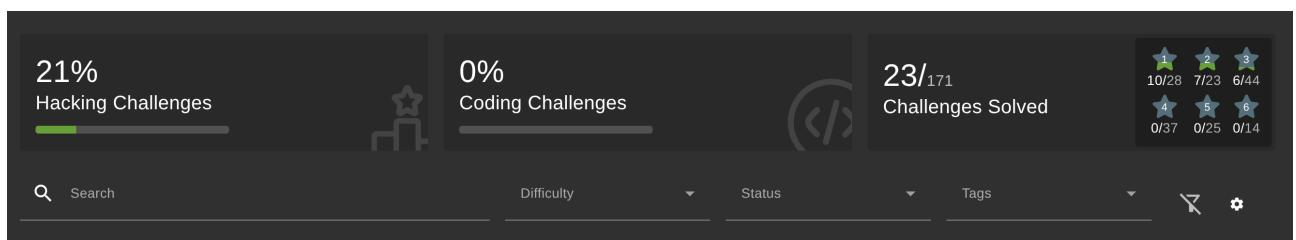

Figure 1: count of solved problems

The figure shows the OWASP Juice Shop scoreboard page with a grid of challenges. The challenges are categorized and include:

- Miscellaneous:
 - Score Board
 - Privacy Policy
- XSS:
 - DOM XSS
 - Bonus Payload
- Sensitive Data Exposure:
 - Confidential Document
- Security Misconfiguration:
 - Error Handling
- Improper Input Validation:
 - Exposed Metrics
 - Missing Encoding
 - Repetitive Registration
- Unvalidated Redirects:
 - Outdated Allowlist
- Broken Access Control:
 - Web3 Sandbox

Each challenge card includes a title, description, tags (e.g., Tutorial, Hint), and a 'Solve' button. The browser's address bar shows 'localhost:3000/#/score-board'.

The screenshot shows the OWASP Juice Shop application's score-board page at localhost:3000/#/score-board. The page displays a grid of security challenges categorized by type:

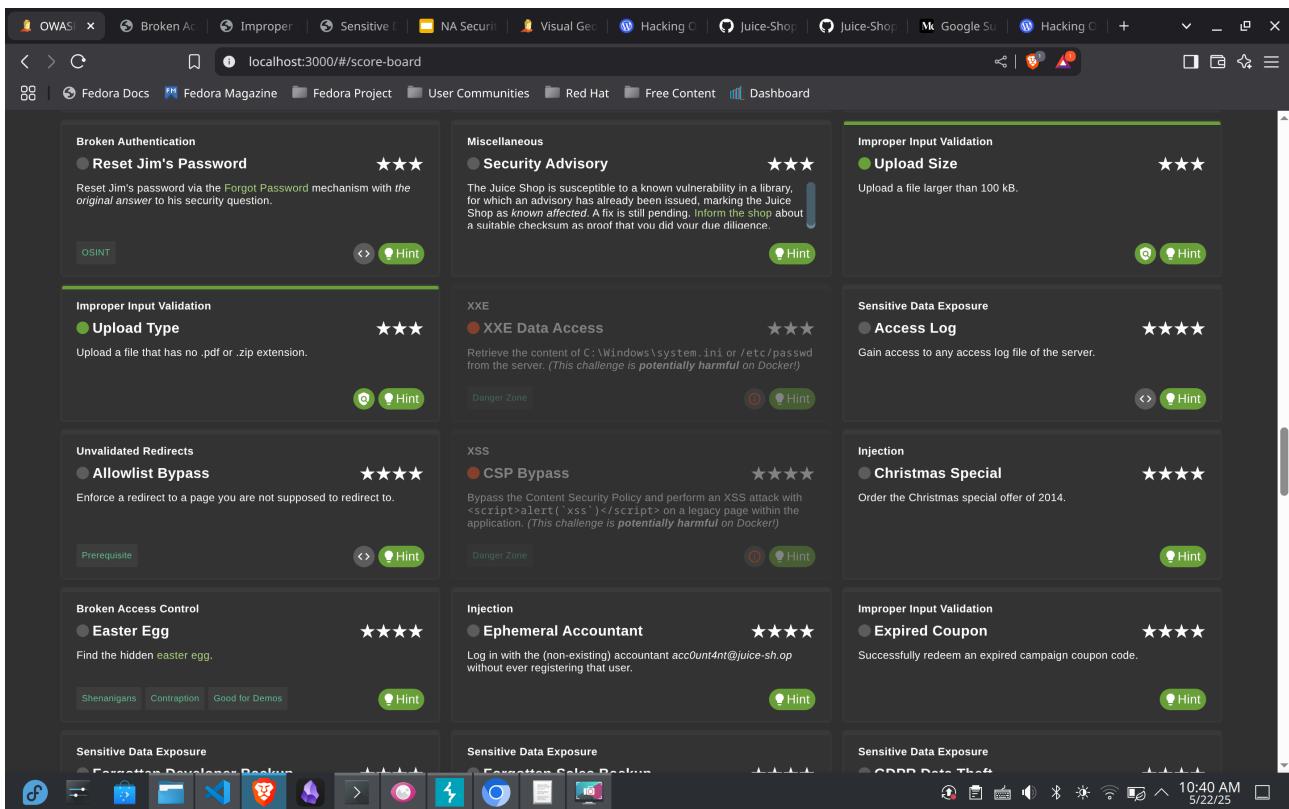

- Broken Access Control:**
 - Web3 Sandbox (Green)
 - Exposed credentials (Green)
 - Password Strength (Grey)
 - Empty User Registration (Green)
- Improper Input Validation:**
 - Zero Stars (Grey)
 - Reflected XSS (Red)
- Injection:**
 - Login Admin (Green)
 - View Basket (Grey)
 - Five-Star Feedback (Green)
 - Admin Section (Green)
- Sensitive Data Exposure:**
 - Exposed credentials (Green)
 - Meta Geo Stalking (Grey)
 - NFT Takeover (Green)
 - NET Takeover (Green)
- Broken Authentication:**
 - Deprecation Interface (Grey)
 - Security Policy (Grey)
- XSS:**
 - Reflected XSS (Red)
- Miscellaneous:**
 - Shenanigans (Grey)
 - OSINT (Grey)
 - Good Practice (Grey)
 - Danger Zone (Grey)
 - Brute Force (Grey)

Each challenge card includes a star rating, a brief description, and buttons for Hint, Tutorial, and Good for Demos.

The screenshot shows the OWASP Juice Shop application's score-board page at localhost:3000/#/score-board. The page displays a grid of security challenges categorized by type:

- Sensitive Data Exposure:**
 - Meta Geo Stalking (Grey)
 - Visual Geo Stalking (Green)
- Cryptographic Issues:**
 - Weird Crypto (Grey)
- Injection:**
 - Login Jim (Green)
 - Login Bender (Green)
- Improper Input Validation:**
 - Admin Registration (Green)
- Broken Access Control:**
 - Forged Feedback (Green)
- XSS:**
 - API-only XSS (Red)
- Miscellaneous:**
 - Security Policy (Grey)
 - Forged Feedback (Green)
 - Brute Force (Grey)

Each challenge card includes a star rating, a brief description, and buttons for Hint, Tutorial, and Good for Demos.

2 Write-Up

2.1 Bully Chatbot (1)

Just tell it your name then keep asking about the coupon codes (for 10 or more times), and the chatbot will give you the answer.

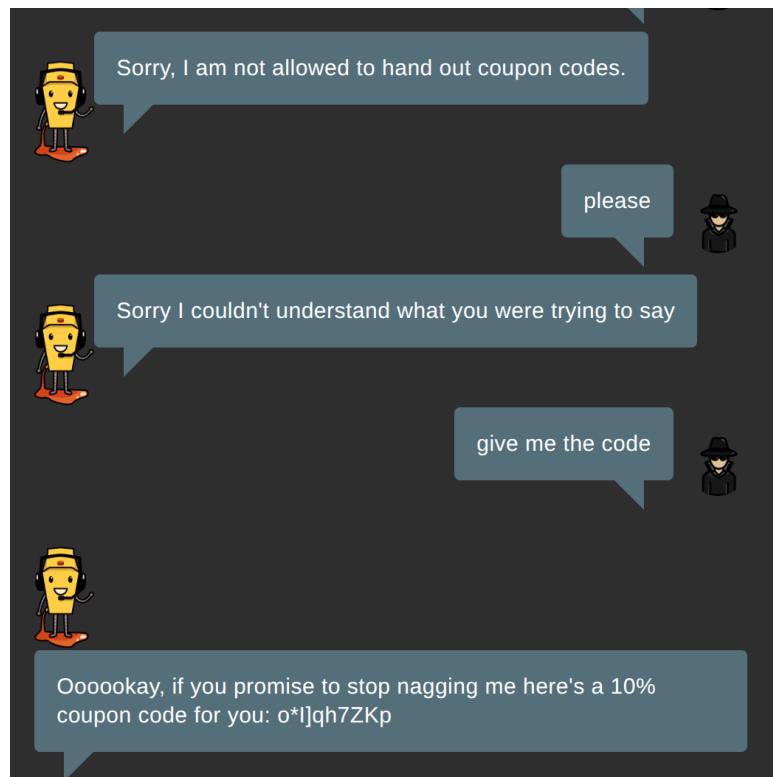

Figure 2: The conversation between me and chatbot

2.2 Missing Encoding (1)

After entering the Photo Wall, we can notice a photo can't be displayed. Inspect the photo's html, we can find its path is not encoded in URL encoding (i.e. percent-encoding), convert the path to correct format using online [tools](#), the filename becomes:

`%e1%93%9a%e1%98%8f%e1%97%a2-%23zatschi-%23whoneedsfourlegs-1572600969477.jpg`

Fill it to original place in html code, we can see the photo is properly displayed!

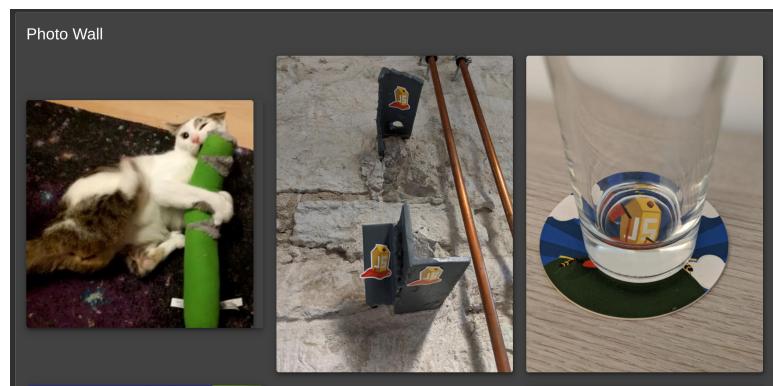

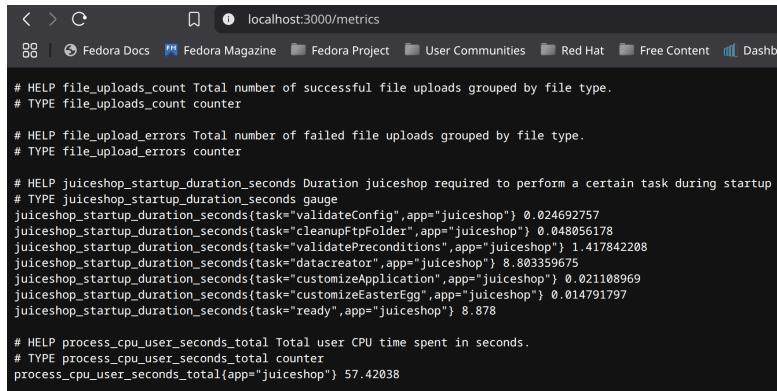

Figure 3: cat

2.3 Exposed Metrics (1)

Following the RTFM route, I read prometheus's document, and see the default path for reading its metrics is `/metrics`.

Then I enter the URL `localhost:3000/metrics` in my browser, I can see something like the site's metrics, that's it.

```
# HELP file_uploads_count Total number of successful file uploads grouped by file type.
# TYPE file_uploads_count counter

# HELP file_upload_errors Total number of failed file uploads grouped by file type.
# TYPE file_upload_errors counter

# HELP juiceshop_startup_duration_seconds Duration juiceshop required to perform a certain task during startup
# TYPE juiceshop_startup_duration_seconds gauge
juiceshop_startup_duration_seconds{task="validateConfig",app="juiceshop"} 0.024692757
juiceshop_startup_duration_seconds{task="cleanupPftFolder",app="juiceshop"} 0.048056178
juiceshop_startup_duration_seconds{task="validatePreconditions",app="juiceshop"} 1.417842208
juiceshop_startup_duration_seconds{task="datacreator",app="juiceshop"} 8.803359675
juiceshop_startup_duration_seconds{task="customizeApplication",app="juiceshop"} 0.021108969
juiceshop_startup_duration_seconds{task="customizeEasterEgg",app="juiceshop"} 0.014791797
juiceshop_startup_duration_seconds{task="ready",app="juiceshop"} 8.878

# HELP process_cpu_user_seconds_total Total user CPU time spent in seconds.
# TYPE process_cpu_user_seconds_total counter
process_cpu_user_seconds_total{app="juiceshop"} 57.42038
```

Figure 4: exposed metrics :D

2.4 Error Handling (1)

Type URL `http://localhost:3000/rest` in my browser, and I see the following error:

Figure 5: error page

2.5 Repetitive Registration (1)

Open burpsuite's browser, and then start intercepting it. Register a user normally, in the POST request, edit the content in Repeat Password field to a different one, then forward the request. It's done.

2.6 Exposed credentials (2)

Open brave browser's Dev tools (Press F12), and then click on **Sources**, select `main.js`, search for `Username` and `Password`, we can find two lines written `testingUsername` and `testingPassword`.

And then logging in using the password and username we just found. :D

```

    router;
    formSubmitService;
    basketService;
    ngZone;
    emailControl = new s.hs("", [s.k0.required]);
    passwordControl = new s.hs("", [s.k0.required]);
    hide = !0;
    user;
    rememberMe = new s.hs(!1);
    error;
    clientId = "1005568560502-6hm16lef8oh46hr";
    oauthUnavailable = !0;
    redirectUri = "";
    testingUsername = "testing@juice-sh.op";
    testingPassword = "IamUsedForTesting";
    constructor(e, o, a, r, l, d, S, x) {
        this.configurationService = e,
        this.userService = o,
        this.windowRefService = a,
        this.cookieService = r,
        this.router = l,
        this.formSubmitService = d,
        this.basketService = S,

```

Figure 6: Hardcoded username and password in main.js

2.7 Mass Dispel (1)

Following the instructions in official [page](#) of owasp-juiceshop, we can just press shift and click the button for closing simultaneously, then all the success notifications will be closed.

2.8 Admin subsection (2)

In Dev Tools > Source > main.js, search for something like admin, then we can find a path called administration. Enter the page <http://localhost:3000/#/administration>, the challenge is solved, yeah!

2.9 Five-Star Feedback (2)

Follow the previous problem, we enter <http://localhost:3000/#/administration> and clean all the five stars Feedbacks. done.

2.10 Login Jim (3)

To login as Jim, we should find its email first, the email is leaked in some product reviews (like OWASP Juice Shop Holographic Sticker), it's `jim@juice-sh.op`, and after that we can use SQL injection to force system ignore the validity of password.

In user email field, enter `jim@juice-sh.op'--` to comment out the following password query (The password can be anything). We should be able to login Jim's account now.

2.11 Empty User Registration (2)

Open burpsuite's browser, turn intercept on. After normally registering a user, an POST request is captured by burpsuite, then we can edit the username and password to empty and forward the packet.

2.12 Outdated Allowlist (1)

Search for `redirect` in Devtools > Source > `main.js`, and we can find something like:

```

1 showBitcoinQrCode() {
2     this.dialog.open(qt, {
3         data: {
4             data: "bitcoin:1AbKfgvw9psQ41NbLi8kufDQTezwG8DRZm",
5             url: "./redirect?to=https://blockchain.info/
6             address/1AbKfgvw9psQ41NbLi8kufDQTezwG8DRZm",
7             address: "1AbKfgvw9psQ41NbLi8kufDQTezwG8DRZm",
8             title: "TITLE_BITCOIN_ADDRESS"
9         }
10    })
11 }
```

And we can just visit `localhost:3000/redirect....` (接上 url 中除了 `./` 的), the problem is solved.

2.13 Visual Geo Stalking (2)

In Photo Wall, we can find the image uploaded by Emma (her signature is $E = ma^2$), and the only visible text is IT sec. Then I tried use `emma@juice-sh.op` (the email can be find in `localhost:3000/#/administration`) and the answer ITsec to the private problem to change her password, I got a huge success in the end.

2.14 Admin Registration (3)

In problem `Admin subsection`, open the Dev Tools, enter `Network` (maybe reloading the page is needed), we can see `authentication details` between it. Just check its response, we can see a JSON formate file shown as the following:

```

    "id": 1,
    "username": "",
    "email": "admin@juice-sh.op",
    "password": "*****",
    "role": "admin",
    "deluxeToken": "",
    "lastLoginIp": "",
    "profileImage": "assets/public/images/uploads/defaultAdmin.png",
    "totpSecret": "",
    "isActive": true,
    "createdAt": "2025-05-22T00:43:42.831Z",
    "updatedAt": "2025-05-22T00:43:42.831Z",
    "deletedAt": null,
    "lastLoginTime": 1747828780
},
{
    "id": 2,
    "username": "",
    "email": "jim@juice-sh.op",
    "password": "*****",
    "role": "customer",
    "deluxeToken": "",
    "lastLoginIp": "",
    "profileImage": "assets/public/images/uploads/default.svg",
    "totpSecret": "",
    "isActive": true,
    "createdAt": "2025-05-22T00:43:42.831Z",
    "updatedAt": "2025-05-22T00:43:42.831Z",
    "deletedAt": null,
    "lastLoginTime": null
}
,
```

Obviously, the only difference between admin and normal user is the role field. So, we open burp suite and its browser, intercept it, try normally register a random user, and add one line to its data in the POST request: "role": "admin", forward it in the end.

The challenge is solved, yeah!

2.15 Forged Feedback (3)

Login in anyone's account (maybe admin?) (Before that use burp suite's browser and intercepting its HTTP traffic), after we sending a Feedback, we can check the content in POST request, just change the UserID and forward the request, the challenge is solved! uwu

2.16 NFT takeover (2)

Enter the source in Dev tools, we can search for nfs in main.js, then we should be able to find a path called juicy-nft. Following the hint I enter localhost:3000/#/juicy-nft, the bot asks me to enter a private key.

In previous problem, the administration subsection shows a Feedback contains following contents, seems suspicious:

```

Please send me the juicy chatbot NFT in my wallet at /juicy-nft : "purpose
→ betray marriage blame crunch monitor spin slide donate sport lift clutch"
→ (***)ereum@juice-sh.op)

```

I use the sentence: purpose betray marriage blame crunch monitor spin slide donate sport lift clutch, as the seed passphrase, and use websites like [this](#) to convert it to private key. (it's eth by the way)

The key is obtained, I enter it to the field in `./juicy-nft`, the challenge is solved, yeah! (Remember to add `0x` to the private key since it's a hex string).

2.17 Web3 Sandbox (1)

Enter `http://localhost:3000/#/web3-sandbox`, it's done.

2.18 Upload Type (3)

Try submit the complaint and attach a file in burp's browser (with intercepting). Then we edit the POST request's filename field to one with txt extension (or other). Then the challenge is solved!

2.19 Upload Size (3)

Just type many text in a text file `test.txt` (make it very close but smaller than 100Kb), and rename it to `test.txt.zip`. Open burpsuite's browser and intercept its traffic, after uploading that file, we can add "more" content in the POST request, then forward it, the challenge is finished!uwu
